For Asg10, complete the following steps:

1. See the page Java4350: Form Processing with JSP
2. Using the code in the images as guides, write and publish code with the following functionality:
    a. index.html. This page should contain 2 forms. The first form should support entry of the following four items: firstName, lastName, collegeName, phoneNumber. Use appropriate form entry elements for the data. This form should submit to form-processor-one.jsp using the "GET" method.
    The second form should support entry of the following four items: favoriteSport, favoriteTeam, favoritePlayer, reasonFavorite. The first 3 data entry items should each use selection lists. The reasonFavorite data item should use a text area form element. This form should submit to form-processor-two.jsp using the "POST" method.
    b. form-processor-one.jsp. Process "read" the form elements from the submission and output the elements appropriately.
    c. form-processor-two.jsp. Process "read" the form elements from the submission and output the elements appropriately.
3. Publish your assignment per the instructions in "Website Setup & Assignment Publishing" at the link in the Assignments-J section of Bb.
4. In addition to publishing on your student website, compress your NetBeans project folder and then upload that .zip file to Bb at the appropriate assignment link before the due date. ONLY .zip. ONLY .zip. ONLY .zip compression format. What format? .zip.

NOTE: index.html is in the "welcome file" list in web.xml and will therefore be returned by the server when the path to the asg10 directory is supplied in the URL address box.
